

Wero - REST API (V2)

Opening to consumer is planned in 2027.

Wero is a pan-European digital wallet initiative developed by EPI (European Payments Initiative), designed to provide a unified, secure, and instant payment experience across participating EU countries. Built on SEPA Instant Credit Transfer (SCT Inst) rails, Wero aims to be a direct competitor to other mobile wallets and promote cross-border, real-time payments in the euro area.

With a focus on both online and in-store use cases, Wero allows users to send and receive money instantly enhancing convenience while maintaining compliance with European regulatory standards.

Get started

1. Contact [Axepta BNP Paribas Helpdesk](#) to activate Wero payment method for your merchant profile.
2. Integrate by choosing the integration option tailored to your needs.

Integration options

Axepta BNP Paribas supports Wero payments through the following integration types:

- **Hosted Payment Page:** Initiate [Hosted Payment Page](#) by calling [Create checkout session](#).
- **Hosted forms:** Initiate [Hosted forms](#) by calling [Create payment](#) with:

```
"paymentMethods": {  
  "type": "WERO",  
  "integrationType": "HOSTED"  
}
```

Reverse payment

If a payment needs to be voided before settlement, you can initiate a reversal using the [Reverse payment](#) endpoint.

Only unsettled Wero payments can be reversed.

Capture payment

If the payment was initiated with a manual capture flow (`captureMethod.type=MANUAL`), you must explicitly capture the authorized amount using the [Capture payment](#) endpoint.

If the initial transaction did not include the `MANUAL` capture method, the payment will be auto-captured by default.
